

❖ Executive Summary

This project analyzes Alfido Tech's sales performance using Python and Power BI to identify trends, regional performance, top-selling products, and customer behavior. The dataset was cleaned and processed to generate meaningful business insights through KPI metrics and interactive visualizations.

Key analyses included monthly sales trends, category-wise performance, regional sales comparison, customer segment analysis, and top product identification. KPI cards such as Total Revenue, Total Orders, Average Sales, and Total Customers were developed to monitor business performance effectively.

The analysis revealed that certain regions and product categories contributed significantly to overall sales, while seasonal trends highlighted peak sales periods. An interactive Power BI dashboard was created to support data-driven decision-making.

Based on the findings, several tactical recommendations were suggested, including increasing marketing in high-performing regions, promoting top-selling products, improving low-performing categories, preparing inventory for peak seasons, and implementing customer loyalty programs.

Overall, this project demonstrates practical skills in data analysis, visualization, dashboard development, and business intelligence using real-world sales data.
